

**Wallis,
the first female technician of
TOWSC is happy to share her
O&M working experience.**

Can you tell us about yourself?

I consider myself an adventurer which I like challenging activities such as scuba diving, snowboarding and sky diving. I really enjoy heights and the astonishing views from above.

I want to fly my own color in this life so I choose the uncommon work compared to the other women in Taiwan. I was a technical sergeant for fighter maintenance in Air Force and was one of the very first two female technicians who was sent to Denmark to learn blade manufacturing.

The most challenging part?

To remind myself to keep a flexible mindset.

You have to get used to the work habits of different competent technicians and be flexible to work with them as well as the working environment. The working status will change in seconds, I have to comprehend and understand it immediately, accept it willingly and respond to it quickly.

What motivates you to become a wind turbine technician?

“I want to go on the top of wind turbines and enjoy the endless horizon surrounded by ocean views.” This is the real first thought in my mind. Then I realized that this is a sustainable job and not easy to be replaced. It has all the features of shaping a better career.
